

The ORRC completed a cleanup of the database in early 2009 by compiling a list of all coordinations that had not been updated for more than three years. Pursuant to the By Laws, those coordinations were required to be de-coordinated. As a courtesy, and in an effort to get anyone willing updated, the services of an attorney was secured and certified letters as well as first class copies were mailed to all coordination holders at the last known address. Also, the frequencies were posted on the website for six months to gain as much attention as possible. While many updated, we found many frequencies no longer in use or coordination holders that were no longer in the area.

The frequencies that were not updated that were in the VHF region are published below with the nearest city to the transmitter location. Since VHF frequencies are at a premium and in many areas there are no VHF frequencies available, effective July 1, 2009 these frequencies will be posted as 'available' for 60 days. Applications will be accepted via the Technical Data Form published on the website during these 60 days, with the final cutoff date being September 6, 2009.

After September 6, 2009, all applications will be reviewed for compliance with the following requirements:

- a. The application will contain proof of access to a suitable site.
- b. The proposed new system will provide coverage similar to the system previously authorized on the frequency.
- c. The applicant will be eligible to operate an amateur radio system in the band to be utilized.

If there are competing applications for the same site/frequency, the winning applicant will be selected by a drawing. The selected applicant is required to file a new TDF within 14 days with the up to date information on the proposed repeater, also co-channel sharing agreements will be required from cochannel users.

When all the information is received and 180 day construction permit will be issued.
